

Important criteria for testing chemical resistance are temperature, the concentration of the agents, the residence time and the mechanical load. The resistance against various chemicals is listed in the following table. These details correspond to the present state of our knowledge and are meant to provide information about our products and their applications. They do not mean that the chemical resistance

of products or their suitability for a particular purpose is guaranteed in a legally binding way. Any existing commercial proprietary rights are to be taken into account. For specific applications it is recommended that suitability is first established. Standard testing is performed in normal climatic conditions 23/50 according to DIN EN ISO 291.
